

Modelling and simulation of Tower structure of small wind turbine

In this project you will work beside other members of the student competition team for small wind turbine, and learn basics of wind turbine design, wind energy and work together to create a compound model of tower structure using the available components such as yaw system, electrical box and wiring, and the yaw mechanism. The goal of this project is to simulate the tower in working conditions using the multi-body dynamic simulations together with the finite element modelling of the flexible parts for kinetic and kinematic simulations as well as stress and frequency analyses. This will help the team to create a complex computer model of the whole turbine including different mechanical and electrical sub-systems.

Main tasks/requirements:

- Modelling using Siemens NX or equivalent
- Coupled dynamic and FEM simulations using Simcenter3D or equivalent
- Preparation of the report of your work explaining the approach, solutions, and discussions on results
- Contribution to the final report of the team for the competition
- Contribution in preparation of the wind turbine
- Participation in weekly team meetings (online for remote students)
- Teamwork and communication with other team members
- Intermediate English knowledge or above
